Page 226	Page 230	Page 234	Page 238
			

CHARCOAL ROT

Macrophomina phaseolina

WHAT SHOULD I LOOK FOR?

Seedlings with early infection show water-soaked lesions at soil line that may choke and kill the plant
H. Schwartz, Colorado State University, Bugwood.org

As the disease progresses amber coloured ooze, similar to gummy stem blight, may be released. Lesions eventually dry out and many survival structures (microsclerotia) may be seen in the dead tissue

P. Bachi, University of Kentucky Research and Education Center, Bugwood.org

Infected fruit develop large soft grey to black sunken lesions, shown here in an infected cucumber

C. Averre North Carolina State University, Bugwood.org

• Consult APVMA or InfoPest website for current registered products

HOST RANGE

Very wide host range infecting over 500 plant species including most members of the pumpkin, bean, brassica and pepper vegetable families

DAMPING OFF

Rhizoctonia spp. | *Pythium* spp. | *Phytophthora* spp. | *Fusarium* spp.

WHAT SHOULD I LOOK FOR?

Where direct seeding is used plants may not emerge, resulting in bare patches. Infected seedlings that do emerge develop water soaked dark brown lesions at base of stem, shown here in cucurbit seedlings infected with (a) *Rhizoctonia* spp. and (b) *Pythium* spp.

G. Holmes, California Polytechnic State University, Bugwood.org

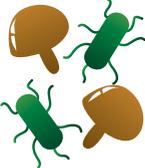

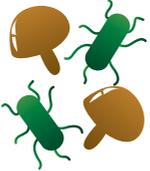

Plants experience stunting, wilting and eventual death

G. Holmes, California Polytechnic State University, Bugwood.org

HOST RANGE

Very wide, including all vegetables in the pumpkin (cucurbit) family.

FUSARIUM FOOT ROT

Fusarium solani f.sp. cucurbitae

WHAT SHOULD I LOOK FOR?

Light brown water-soaked rot on crown and upper root which eventually chokes plant. Leaves wilt followed by plant death. Crown often breaks off and secondary pathogens invade decaying plant tissue sometimes producing a bad odour.

M. Lloyd, University of California, Co-operative Extension

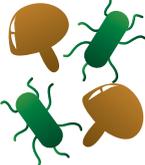

Pink to white fungal mycelium is often found on the soil surface beside the lesion and darkened soil may also be evident

M. Lloyd, University of California, Co-operative Extension

<p>WHERE WILL I SEE SYMPTOMS?</p> <p>LEAVES CROWN / UPPER ROOT SYSTEM ROOTS</p>	<p>FAVOURABLE CONDITIONS FOR DISEASE DEVELOPMENT</p> <p>WARM</p> <p>• 25-30°C</p>

• Consult APVMA or InfoPest website for current registered products

HOST RANGE

Zucchini, pumpkin

FUSARIUM WILT

Fusarium oxysporum f. sp. cucumerinum (cucumber)

WHAT SHOULD I LOOK FOR?

Discolouration of stem at ground level may be seen, in (a) younger seedlings and (b) more mature plants with pale pink fungal growth evident at the base

(a) C. F. Hong, University of Georgia, Bugwood.org (b) L. Tesoriero, Crop Doc Consulting

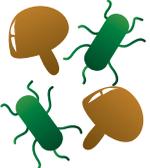

Lower leaves on young infected plants will be stunted, wilted and turn yellow (often more on one side). Cutting stem reveals brown discoloration of the internal tissue

Ontario Crop IPM, OMAFRA

<p>• Especially at seedling stage</p>						

HOST RANGE

Cucumber

GUMMY STEM BLIGHT

Stagonosporopsis cucurbitacearum

WHAT SHOULD I LOOK FOR?

Symptoms begin as water-soaked lesions and with age can dry out, form rings and produce small black survival structures (pycnidia)

B. Watt, University of Maine

Small black survival structures (pycnidia) may be seen on older leaf or stem lesions

L. Tesoriero, Crop Doc Consulting

<p>WHERE WILL I SEE SYMPTOMS?</p>	<p>FAVOURABLE CONDITIONS FOR DISEASE DEVELOPMENT</p> <p>• 20-24°C</p>

HOST RANGE

Very wide with over 2000 plant species acting as hosts to root-knot nematode

SCLEROTINIA ROT (WHITE MOULD)

Sclerotinia sclerotiorum | *Sclerotinia minor*

WHAT SHOULD I LOOK FOR?

Symptoms begin as water-soaked lesions which eventually rot and collapse. As the disease progresses characteristic white fluffy growth develops followed by black fruiting bodies (sclerotia)

M. Gammelgaard, Plantesyddomme

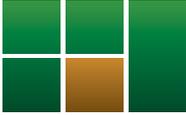

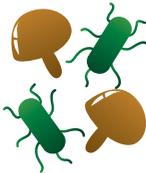

Survival structures (sclerotia) can be up to 25mm long in *S. sclerotiorum* and much smaller (up to 3mm long) in *S. minor*

M. Gammelgaard, Plantesyddomme

HOST RANGE

Very wide (more than 400 different plant species). Infects most vegetable crops including all brassicas and many broadleaf weeds e.g. shepherd's purse, thistles, mustard, pigweed

SCLEROTIUM ROT

Sclerotium rolfsii

WHAT SHOULD I LOOK FOR?

Watery rot that eventually leads to collapse of infected area. Characteristic white “ropey” fungal growth develops along with light brown survival structures (sclerotia)

L. Tesoriero, Crop Doc Consulting

Sclerotia may develop on the infected tissue or soil surface and resemble mustard seeds

G.Holmes, California Polytechnic State University, Bugwood.org
